

H2AD confirmed in the worldwide top 20 of telemedicine integrated solutions

Saint-Etienne, 15th may 2013.

For the second consecutive year, Berg Insight has analysed the strategy, initiatives and technical potential of the industrial actors present, all over the world, on the M-Health, tele-monitoring and tele-health market. Their report (224 pages) places again the French company H2AD among the 20 international leaders, and single French company, of tele-health integrated solutions.

According to the Berg Insight analysts, at the end of 2012, 2.8 millions patients (+27 % in one year) were using connected medical devices for the follow up of their state of health at home. The study of the international market by the Business intelligence company specialised in the telecom industry shows that the monitoring systems in health will have an annual growth of a 26.9 % until 2017 and that the number of communicating devices will increase by 46.3%.

The driving force of this development lies in the potential that tele-health solutions have now to provide an efficient reply concerning the care of an ever growing panel of chronic diseases: cardiac disease, sleep apnoea, diabetes, asthma and chronic obstructive bronco-pneumopathy.

In France, the quality of its solutions (tele-consultation, regulation, coordination, Tele-assistance, Tele-monitoring) enabled H2AD to win the first private and public tenders of the sector and to build repeatable cases of use. The TWITOO Network solution developed initially on the « Ruby on rails » framework, allows a rapid multi-support (computers, tablets, smart phones) and multi-lingual deployment, which can be considered as revolutionary. The deployment over any place on hearth with a basic GSM coverage is immediate. The functional positioning (Low Cost, Open, Wireless, Worldwide) settled by H2AD in the conception, and afterwards in the deployment, of its offer results in a competitive advantage for the organisations which choose the platform.

About H2AD.

- Created in 2004, H2AD settles and manages 24h/24 Tele-health and Telemedicine services, thanks to a regulation, coordination and medical advise platform. The expertise of H2AD allows to acquire, treat, share and host medical data 24h/24 thanks to a human, logistic, medical and secured chaining.
